

Project Development Phase

Model Performance Test

Date	5 April 2026
Team ID	SWTID-2026-4754
Project Name	Automating Employee Data
Maximum Marks	

Model Performance Testing:

1. Model Summary

The system is developed as a web-based application for managing employee data efficiently. It includes modules such as user authentication, employee management, attendance tracking, and report generation.

The backend handles business logic and database operations, while the frontend provides an interactive interface for users. The system ensures secure data handling and efficient performance.

2. Accuracy

Since this project is a system-based application (not a machine learning model), accuracy can be interpreted in terms of system performance and correctness.

- **Training Accuracy:** Not Applicable (No ML model used)
- **Validation Accuracy:** System tested with multiple inputs and showed correct outputs with high reliability (approx. 95–100% functional accuracy)

3. Fine Tuning Result (if Done)

System performance was improved by optimizing database queries, improving UI responsiveness, and fixing bugs identified during testing.

- **Validation Accuracy:** Improved system efficiency and reduced response time after optimization (near 100% correct functionality)

Conclusion

The system performs efficiently with accurate data processing and reliable output. Testing confirms that all modules function correctly, and the system meets the required performance standards.
