

Project Development Phase Performance Test

Date	05 April 2026
Team ID	SWTID-2026-4754
Project Name	Automating Employee Data
Maximum Marks	

Model Performance Testing:

1. Data Rendered :

The employee dataset, including details such as employee ID, name, department, salary, and attendance, was successfully loaded into the system. The data is displayed properly in tables and visual components without any loss or distortion.

2. Data Preprocessing :

Data preprocessing was performed to ensure quality and consistency. Missing values were handled, duplicate entries were removed, and data types were formatted correctly (e.g., dates and numeric values). This improved the accuracy of the analysis.

3. Utilization of Filters :

Filters and slicers were implemented to allow users to interact with the data easily. Users can filter employee information based on department, role, date, and performance metrics, enabling better analysis.

4. Calculation Fields Used :

Calculated fields were created to derive meaningful insights, such as:

- Total Employees
- Average Salary
- Attendance Percentage
- Performance Rating

These fields help in summarizing and analyzing the data effectively.

5. Dashboard Design :

The dashboard is designed with a clean and user-friendly interface. It includes multiple visual elements like bar charts, pie charts, and line graphs to represent employee data clearly.

- Number of Visualizations / Graphs: 6

6. Story Design :

The story/report is organized to present insights step-by-step, such as employee overview, department analysis, and performance trends. This makes it easy for users to understand and interpret the data.

- Number of Visualizations / Graphs: 5

Conclusion :

The system performs efficiently in terms of data handling, visualization, and user interaction. The use of preprocessing, filters, and calculated fields ensures accurate and meaningful insights
